

Module 03

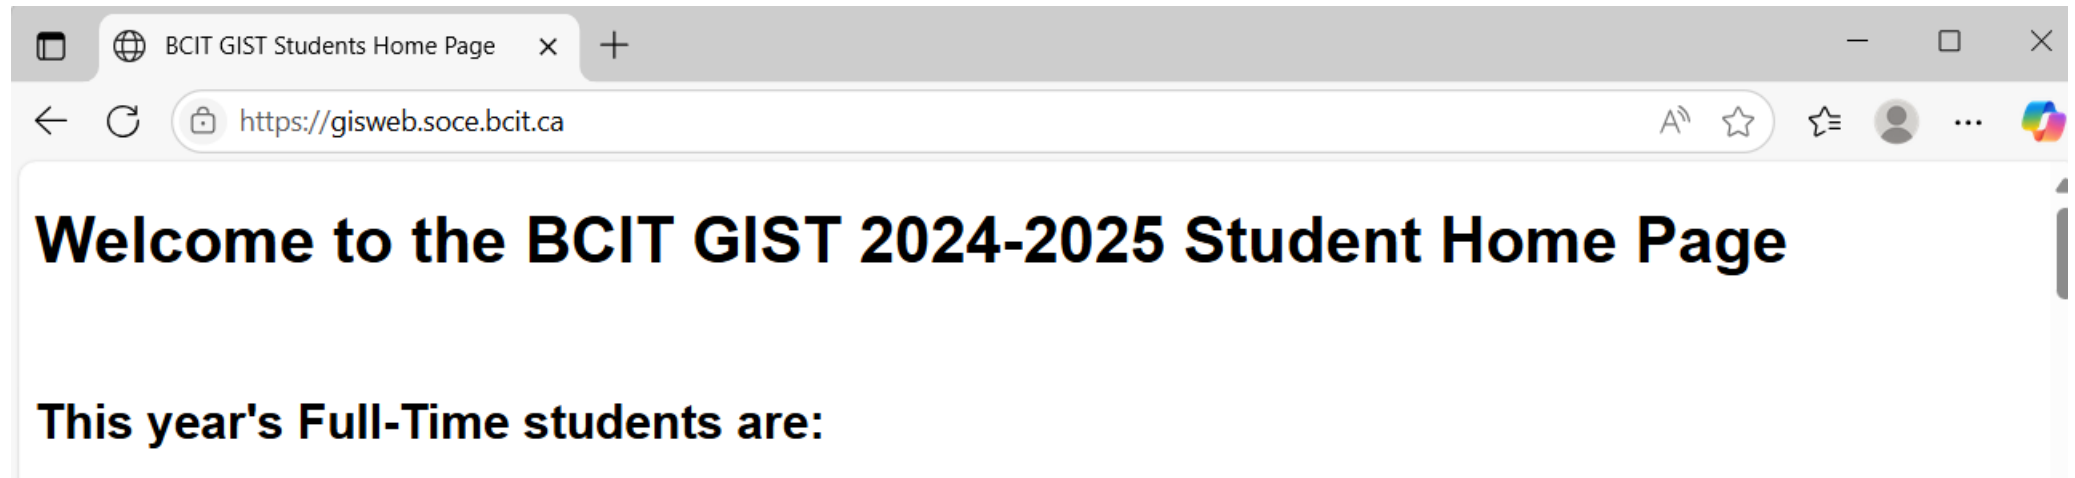

Visual Supplemental Guide

Exercise 1

Request Web Page

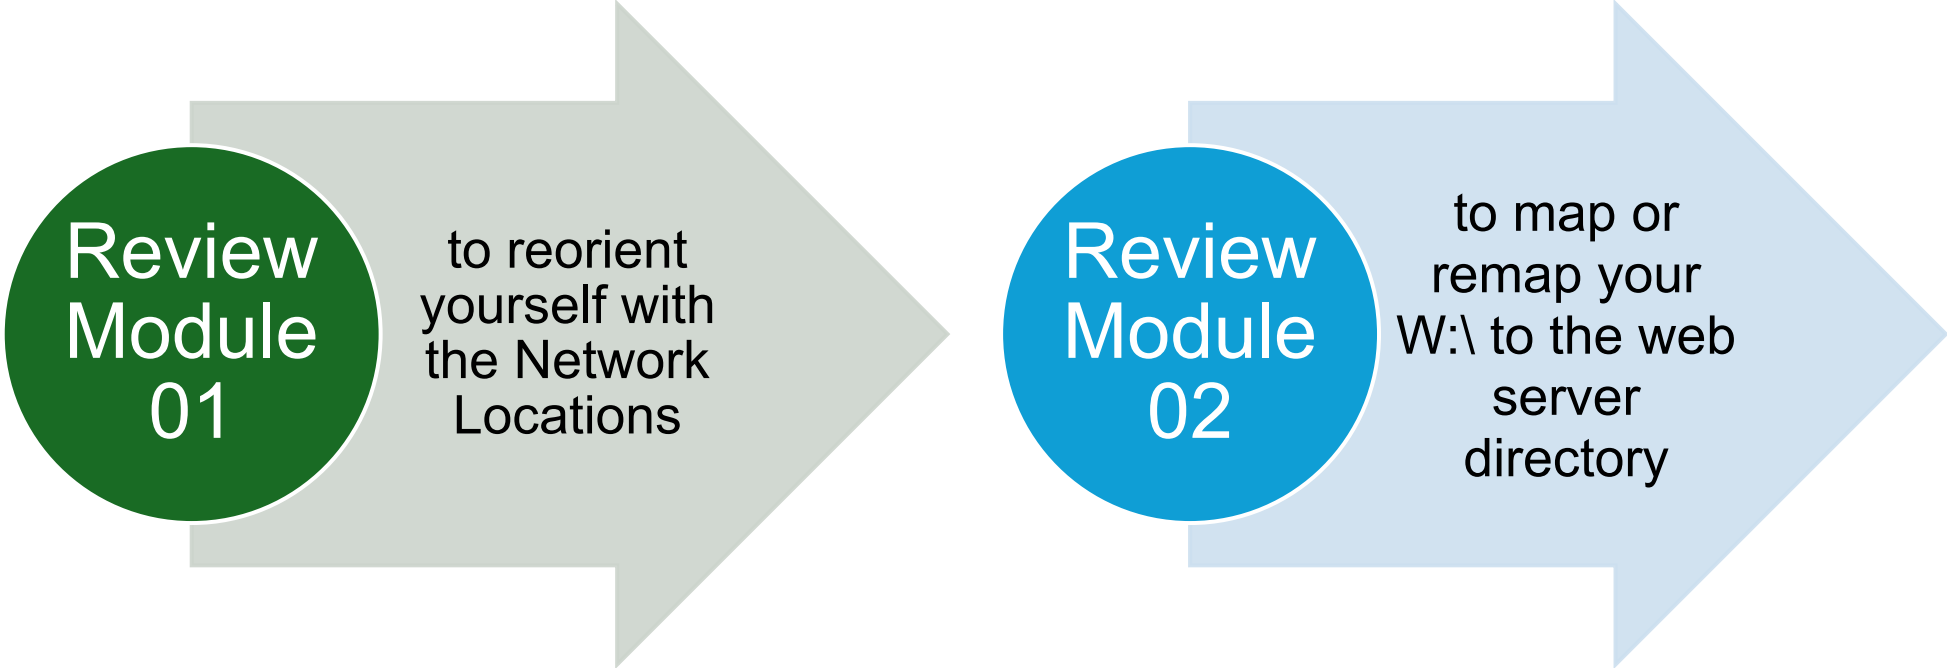

Send Request from Web Client Program

Open a **web client program** (web browser) and enter the following URL <https://gisweb.soce.bcit.ca/>

Exercise 2

Make sure you can access your web directory

Review Module 01

to reorient
yourself with
the Network
Locations

Review Module 02

to map or
remap your
W:\ to the web
server
directory

Exercise 3

A Basic Html Tutorial

HTML Tutorials. And Stuff.

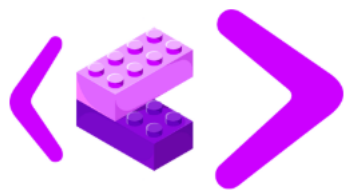

Everything **HTML**, **CSS**, and **JavaScript**,
the most common languages used in making web pages.

Tutorials

Step-by-step guides to get you up and running.

[HTML](#)
[CSS](#)

Techniques

Ways in which HTML, CSS, and JavaScript can be used together to achieve common web design features.

Examples

Interactive bare-bone examples demonstrating code in action.

References

Detail of the individual code ingredients available to you.

HTML: [tags](#), [attributes](#), [characters](#).
CSS: [properties](#), [selectors](#), [values](#).

[Home](#) → [Tutorials](#) →

HTML Tutorials

HTML is where the magic of web page design begins. It isn't presentational — [that's what CSS is for](#) — **HyperText Markup Language** is a simple, elegant way to structure content.

These tutorials use **HTML5**. You might have heard of it. It's a cool buzzword that kids use in the playground. If you don't know what that implies, don't fret - just know that it's the best, most modern flavor of HTML to use.

HTML Beginner Tutorial

A step-by-step guide to HTML basics. If you're completely new to web design, start here.

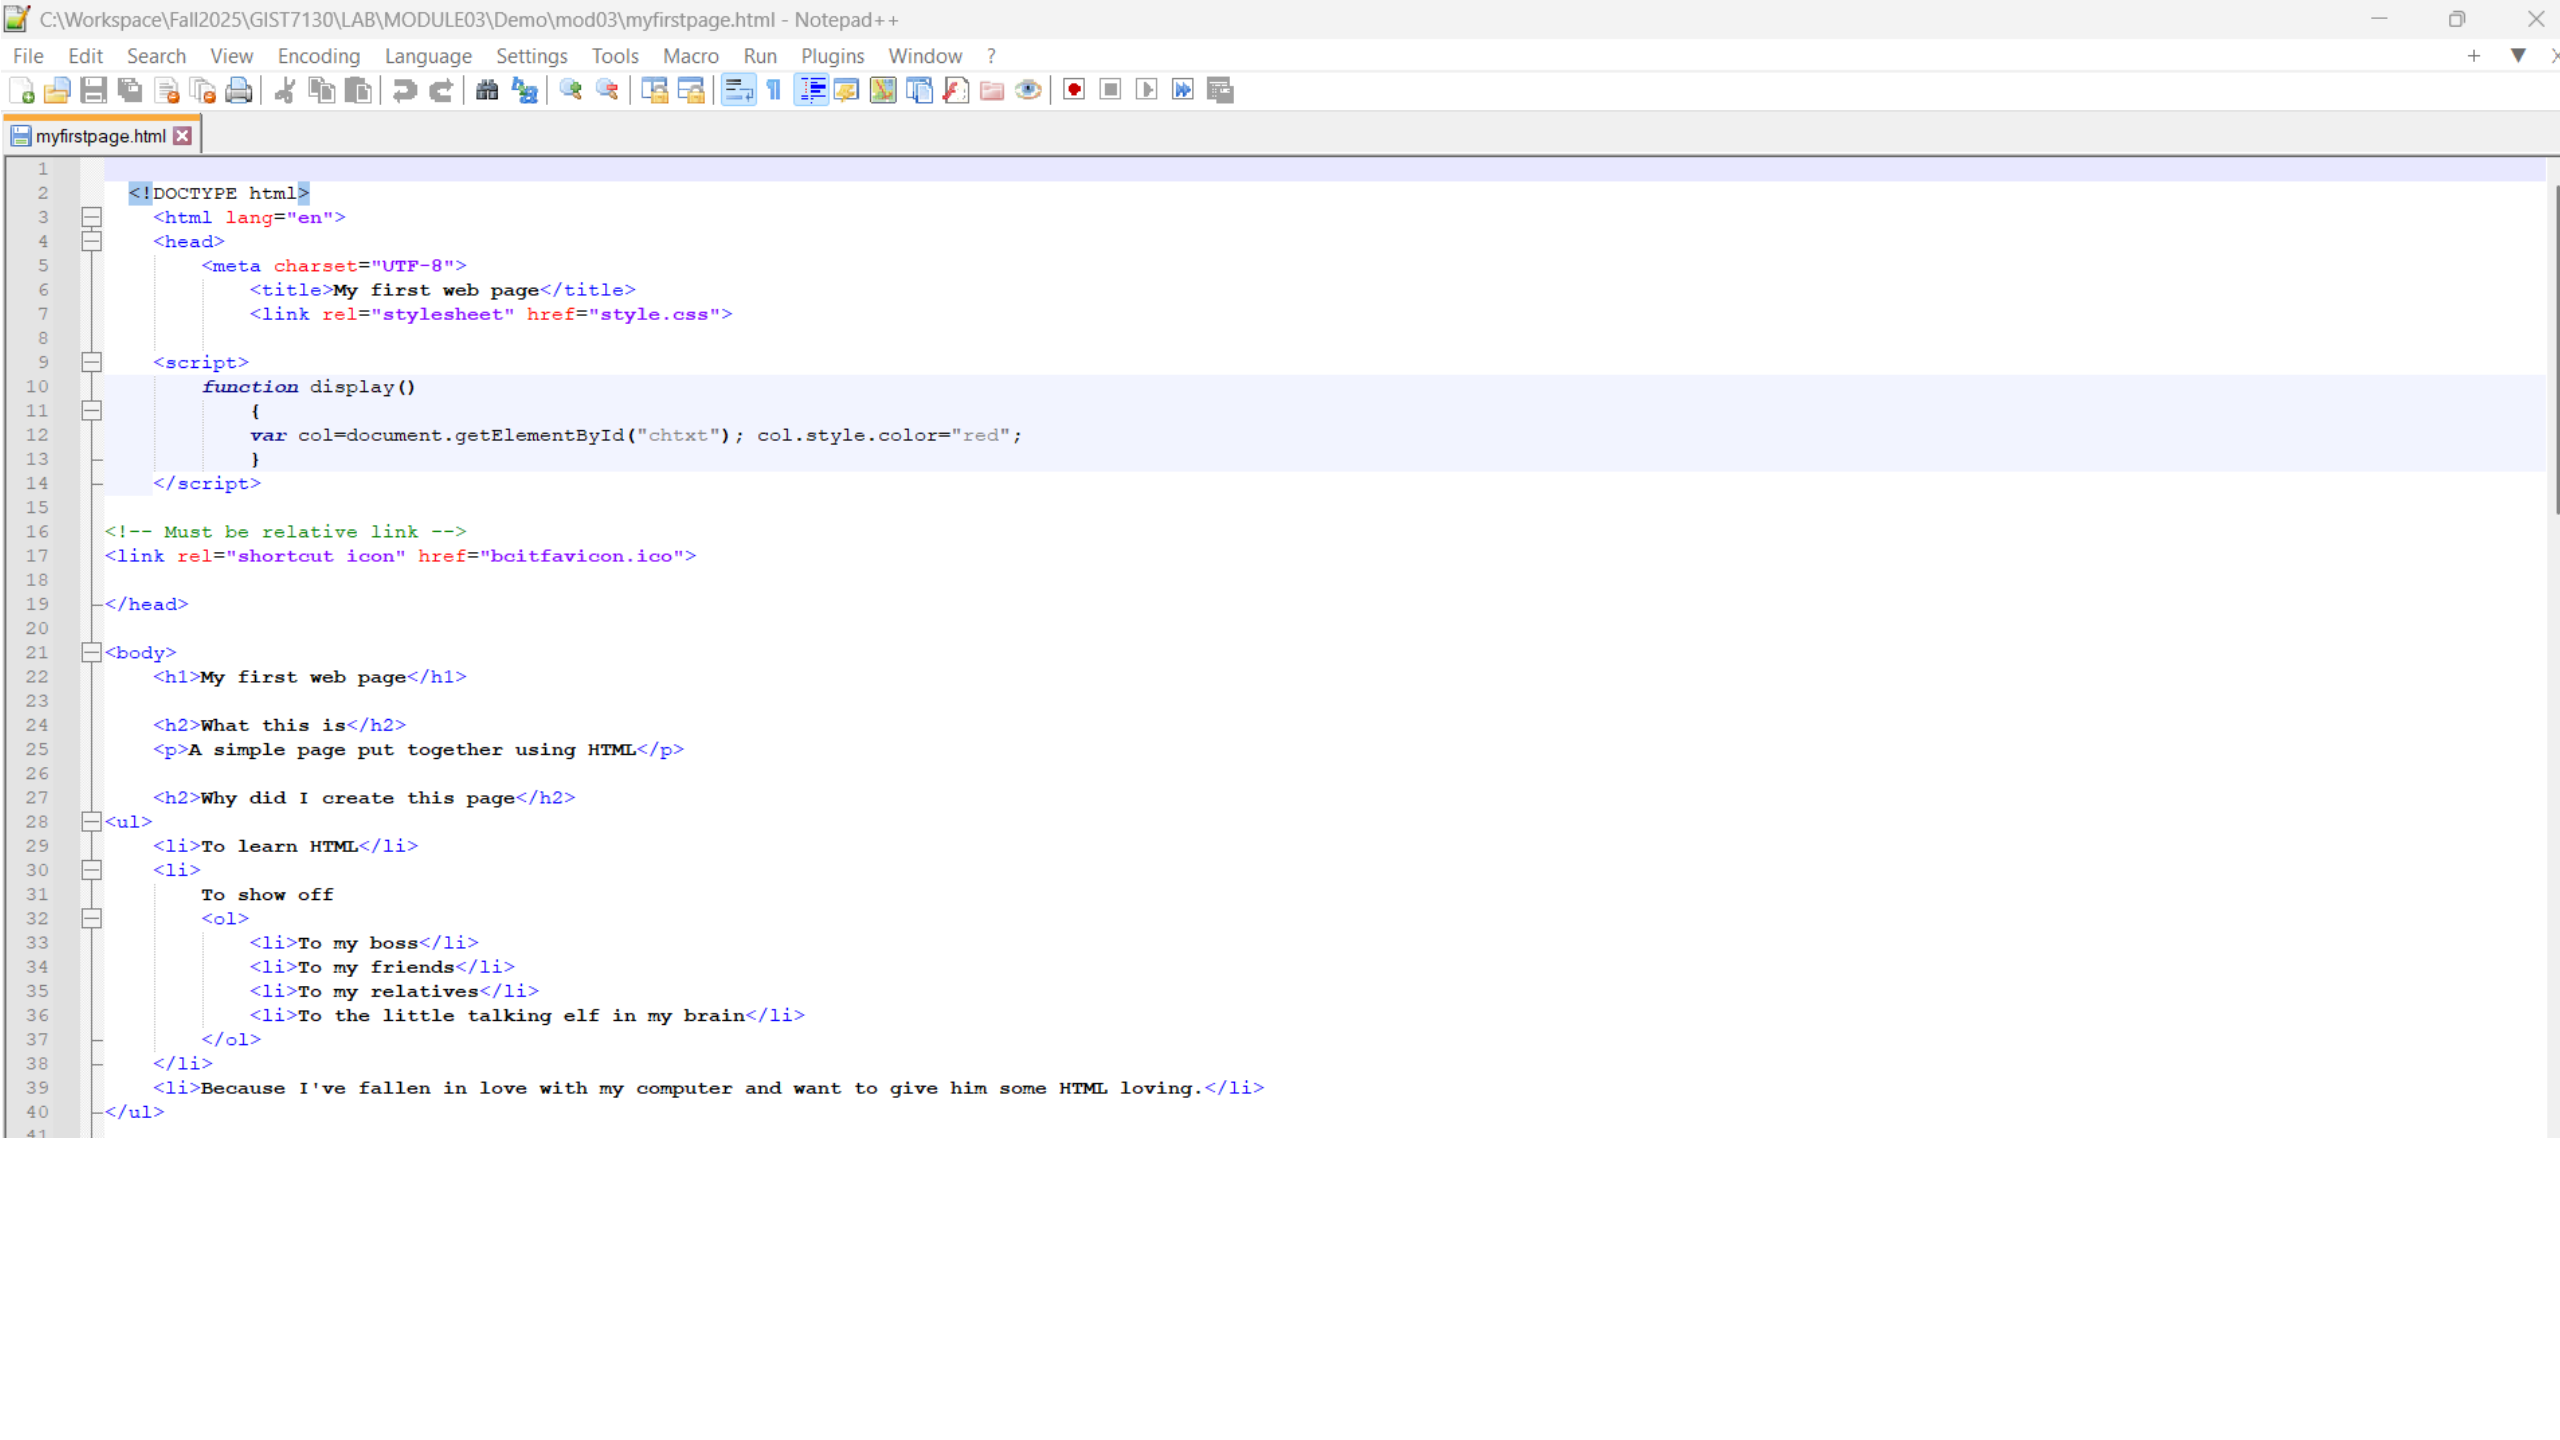

- [Getting Started](#): What you need to do to get going and make your first HTML page.
- [Tags, Attributes and Elements](#): The stuff that makes up HTML.
- [Page Titles](#): Titles. For Pages. A difficult concept, we know...
- [Paragraphs](#): Structuring your content with paragraphs.
- [Headings](#): The six levels of headings.
- [Lists](#): How to define ordered and unordered lists.
- [Links](#): How to makes links to other pages, and elsewhere.
- [Images](#): Adding something a bit more than text...
- [Tables](#): How to use tabular data.
- [Forms](#): Text boxes and other user-input thingamajigs.
- [Putting It All Together](#): Taking all of the above stuff and shoving it together. Sort of in a recap groove.

New Examples Section!

See all of this code stuff in action, and play around with it.

Exercise 4

Cascading Style Sheets Tutorial

[Home](#) → [Tutorials](#) →

CSS Tutorials

CSS exists to style your HTML — to **present** your content. The language of **Cascading Style Sheets** is somewhat different to HTML but it remains simple and straightforward.

Everything in these tutorials comply with **CSS3**. That's the freshest, healthiest, sparkliest flavour of CSS. Its newer aspects will find their way into later tutorial pages.

CSS Beginner Tutorial

A step-by-step guide to CSS basics. Go here if you're comfortable with basic HTML.

- [Applying CSS](#) - The different ways you can apply CSS to HTML.
- [Selectors, Properties, and Values](#) - The bits that make up CSS.
- [Colors](#) - How to use color.
- [Text](#) - How to manipulate the size and shape of text.
- [Margins and Padding](#) - How to space things out.
- [Borders](#) - Erm. Borders. Things that go around things.
- [Putting It All Together](#) - Throwing all of the above ingredients into one spicy hotpot.

For further guidance, consult [Declaring the overall language of a page](#) and [Choosing language tags](#).

If the HTML checker has misidentified the language of this document, please [file an issue report](#) or [send e-mail to report the problem](#).

2. **Error** The character encoding was not declared. Proceeding using `windows-1252`.

Declaring language in HTML

Updated 2021-06-23 16:14

QUESTION

How should I set the language of the content in my HTML page?

This page describes how to mark up an HTML page so that it gives information about the language of the page. It begins with an overall summary, then provides additional details in subsequent sections.

QUICK ANSWER

Always use a language attribute on the `html` tag to declare the default language of the text in the page. This is inherited by all other elements. For example:

```
<html lang="en">
```

Note that you should use the `html` element rather than the `body` element, since the `body` element doesn't cover the text inside the document's `head` element.

🌟 AI Overview

⋮

The error message "The character encoding was not declared. Proceeding using windows-1252" indicates that the HTML document being processed (e.g., by a browser or a validator) does not explicitly specify its character encoding. In the absence of a declared encoding, the system defaults to "windows-1252" as a fallback. This can lead to incorrect display of characters, especially for non-ASCII characters or if the document was actually created using a different encoding like UTF-8.

To resolve this error and ensure proper character display, the character encoding should be explicitly declared within the HTML document. The most common and recommended encoding for modern web pages is UTF-8.

Steps to fix this error:

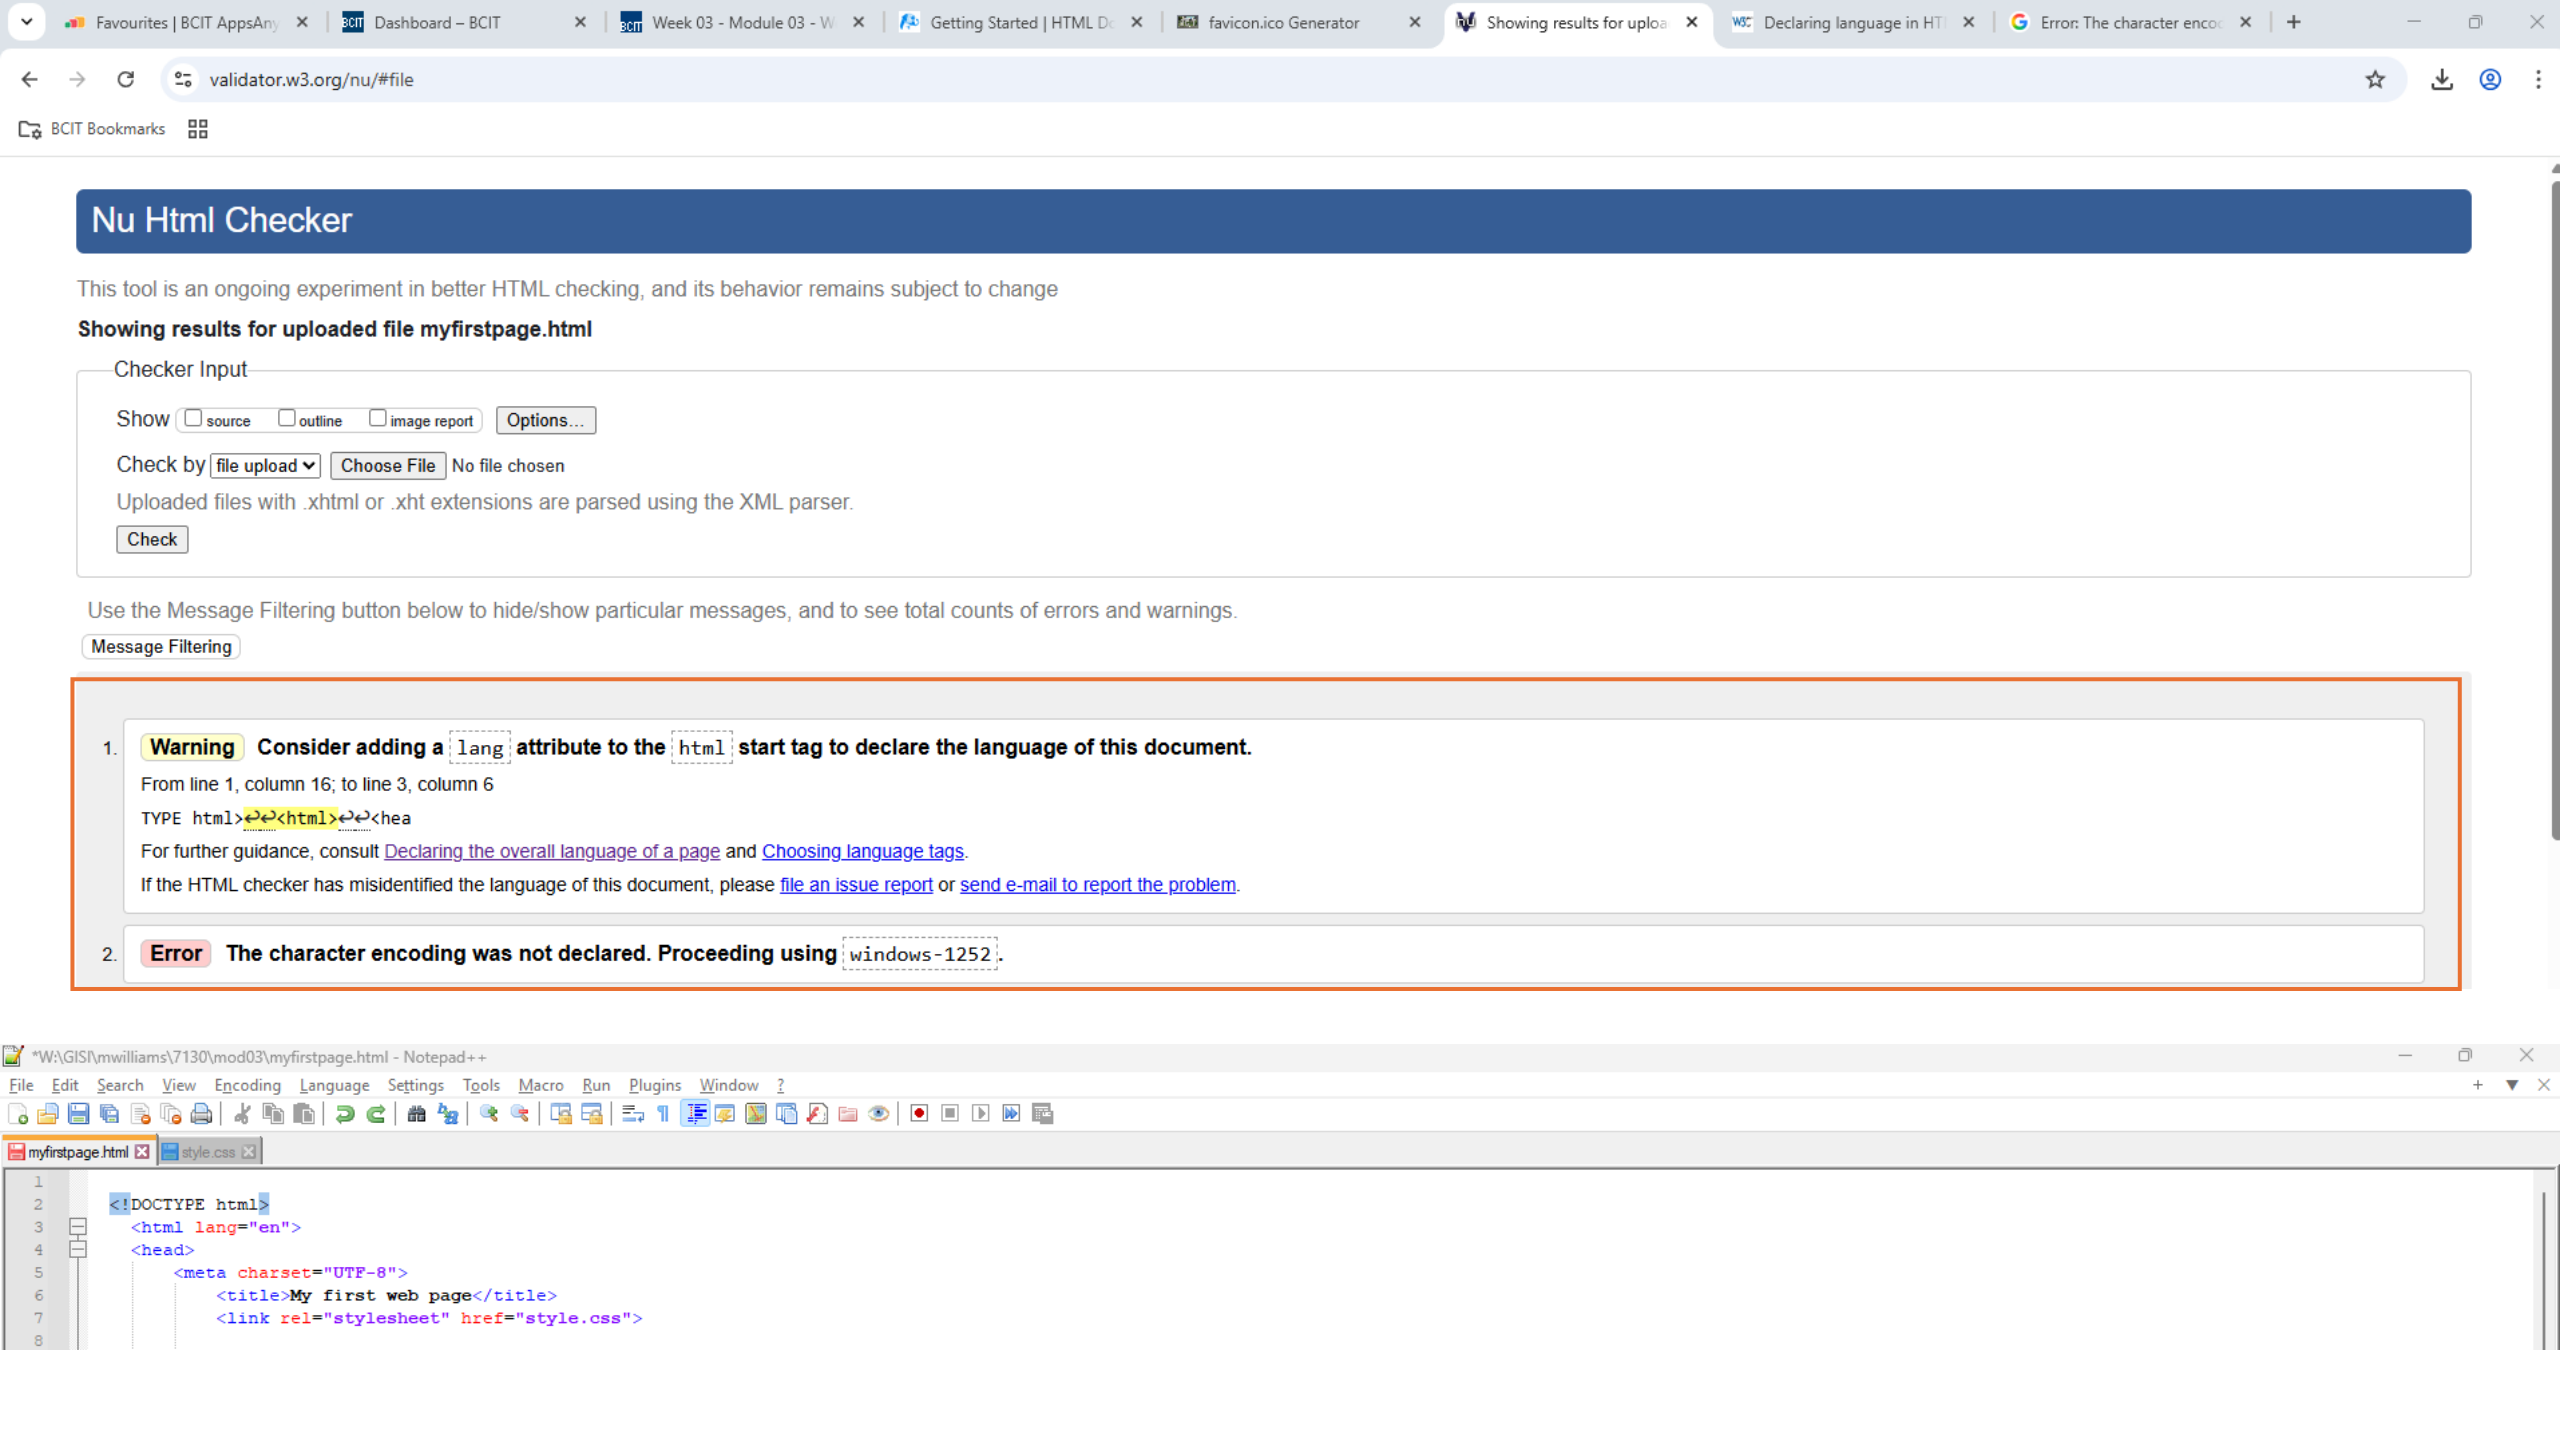

- Add a `meta` tag in the HTML: Include the following line within the `<head>` section of your HTML document, preferably as one of the first elements:

Code

📄

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <title>Your Page Title</title>
</head>
<body>
  <!-- Your content goes here -->
</body>
</html>
```

This `meta` tag explicitly declares the character encoding as UTF-8. It is important that this `meta` tag appears within the first 1024 bytes of the HTML document, as some browsers only scan this initial portion to determine the encoding.

This tool is an ongoing experiment in better HTML checking, and its behavior re
